Pharmacy Management System

User Manual

Author:

Muhammad Hameez Khan

Supervisor :

AL-Magsoosi Husam Kareem Farhan

System Type	Desktop pharmacy operations and inventory system
Platform	Python, PyQt6, SQLite
Audience	Administrators, pharmacists, and software maintainers

1. Introduction

This manual explains how administrators and pharmacists use the Khalis Dawa Pharmacy Management System in day-to-day pharmacy work. It focuses on practical tasks and expected system behavior.

Topic	Details
Target readers	Administrators and pharmacists
Application type	Desktop pharmacy management system
Main tasks supported	Products, batches, sales, prescriptions, returns, audit review, and password management
Records location	Data is stored in the application database and reports are exported to the Downloads folder

2. Starting the Application

1. Open the project on the computer where the system is installed.
2. Run the application.
3. Wait for the login window to appear.
4. Select the correct mode if needed and enter your username and password.

On first launch, the system provides a default administrator account. After signing in, the administrator should update the default password from the Settings page.

3. Understanding User Roles

Role	Main responsibilities	Restrictions
Administrator	Full system control, settings, user support, operational review	None beyond normal validation rules
Pharmacist	Sales, product and batch operations, returns, daily usage	Restricted from selected destructive administrative actions

4. Main Navigation

- Dashboard: quick overview of stock, sales, returns, revenue, low stock, and expiring batches
- Batch Management: add, edit, and review medicine batches
- Point of Sale: process customer purchases
- Product: manage medicine records
- Prescriptions: review prescription-required sales and download reports
- Sales History: review completed sales, download receipts, and start returns

- Returned Items: review completed returns and download return reports
- Audit Logs: review system activity history
- Settings: change passwords and manage account-related admin tasks

5. Daily Operations

This section covers the pages and workflows staff use during normal pharmacy operations.

5.1 Dashboard

1. Open Dashboard from the left navigation.
2. Review the top summary cards for medicines, sales, returned items, expiration alerts, low stock, and revenue.
3. Use the low-stock list to identify medicines that need replenishment.
4. Use the expiring-batches list to identify stock that needs attention.

5.2 Managing Products

5. Open the Product page.
6. Use the search bar or category filter to find a product.
7. Select Add Product to create a new product.
8. Fill in the product name, dosage form, barcode if available, selling price, minimum stock level, category, and prescription requirement.
9. Use Edit to change an existing product.
10. Use Delete only when you are sure the product record should be removed.

If a medicine requires a prescription, make sure the prescription-required option is turned on. This affects checkout behavior in the Point of Sale page.

5.3 Managing Batches

1. Open Batch Management.
2. Use Add Batch to create a stock batch for a medicine.
3. Enter the product, batch number, quantity, and expiry date.
4. Use the search field, category filter, and expired-batch option to narrow the list.
5. Edit batches when quantity, expiry information, or linked product pricing must be corrected.

Batch records are important because the system uses them to decide which stock can be sold and which stock is approaching expiry.

5.4 Processing Sales

1. Open Point of Sale.
2. Browse or search for products.
3. When adding a product, specify the quantity required by the customer.
4. Review the cart and confirm the selected quantities.
5. Choose the payment method during checkout.
6. If prescription medicines are included, provide the customer SSN and customer name.
7. Complete the sale.

- Customer SSN must be nine digits.
- If the customer declines to share SSN and name, checkout is only allowed when no prescription-required medicine is in the cart.
- The system automatically records sale details and updates stock.

5.5 Prescriptions

1. Open the Prescriptions page.
2. Use the search field to find records by SSN, customer name, or medicine name.
3. Review the list of prescription-related sales.
4. Use Report to download a prescription report for the selected record.

Prescription reports are intended to summarize a sensitive medicine sale for documentation purposes.

5.6 Sales History and Receipts

1. Open Sales History.
2. Use the search field to find a sale by receipt number.
3. Review items sold, date, payment type, and total amount.
4. Use Download to export the sale receipt.
5. Use Return to start a return for eligible items.

Receipt numbers are shown in the format #00001, #00002, and so on.

5.7 Processing Returns

1. Open Sales History.
 2. Find the original sale and choose Return.
 3. Select the quantity to return for each eligible item.
 4. Confirm the return after checking the refund amount.
 5. The system creates a return record, adjusts revenue, restores stock, and logs the action.
- Returns are only allowed within the configured return period.
 - Returned items must still satisfy the system validation rules for return eligibility.
 - The original sales receipt remains unchanged.

5.8 Returned Items

1. Open Returned Items.
2. Search by return receipt or source sale receipt when needed.
3. Review returned quantity, return date, refund amount, and source sale.
4. Use Download to export the return report.

5.9 Audit Logs

1. Open Audit Logs.
2. Search by username, role, or action text.
3. Review who performed important actions and when they were performed.

Audit logs are useful when supervisors need to verify who processed a sale, return, password update, or other significant action.

5.10 Settings and Password Management

1. Open Settings as an administrator.
2. Select the account to be updated.
3. Enter the current password required for the selected role.
4. Enter and confirm the new password.
5. Save the change.

6. Exported Documents

Document type	Where it is generated from	Typical use
Sale receipt	Sales History	Customer sale confirmation
Return report	Returned Items	Proof of refund processing
Prescription report	Prescriptions	Sensitive medicine sale record

Generated documents are typically saved to the Downloads folder on the local machine.

7. Good Practice Tips

- Update the default admin password immediately after first use.
- Keep product and batch data accurate before running live sales.
- Record prescription customer details carefully to avoid compliance issues.
- Review low-stock and expiring-batch panels regularly.
- Use audit logs when verifying who performed a sensitive action.

8. Common Questions

Question	Answer
What if the customer will not share SSN?	Proceed only if the cart contains no prescription-required medicine.
Where can I find a completed return?	Open Returned Items and search using the return receipt or source sale receipt.
Why can a return be rejected?	The sale may be outside the return window or the item may no longer be eligible.
Where are receipts and reports saved?	They are exported from the relevant page, usually into the Downloads folder.
